

Legal Connection (LC) - Project Setup

Step 1: Clone the Repository

To get started, clone the repository using the following command:

```
git clone ssh://codeserver.dev.927a2844-ca56-4821-b998-7ded4d96eb36@codeserver.dev.927a2844-ca56-4821-b998-7ded4d96eb36.drush.in:2222/~/repository.git -b master legal-connection-d8
```

Note: Please ensure to use the exact command provided by Pantheon for cloning the repository.

Step 2: Install Lando

Make sure you have [Lando](https://docs.lando.dev/install/macos.html) (https://docs.lando.dev/install/macos.html) installed on your machine. Follow the instructions in the official documentation for installation based on your operating system.

Step 3: Initialize Lando

Once Lando is installed, initialize your site to use Lando by running the following command in your project directory:

```
lando init
```

Follow the prompts displayed on your screen to complete the configuration.

Step 4: Install Dependencies

After initialization, install all required dependencies by running:

```
lando composer install
```

Step 5: Download and Add the Database

Download the latest database backup from Pantheon and place it in your project directory.

Step 6: Import the Database

To import the database, use the following command:

```
lando db-import somedumpfile.sql.gz
```

Step 7: Run Your Site

Now you can run your site by executing the following command:

```
lando start
```
